

FACE RECOGNITION FOR HUMAN COMPUTER INTERACTION USING K- MEANS

DATA FLOW DIAGRAM

FLOW CHART

CODE

The screenshot displays a web browser window with multiple tabs. The active tab is titled 'Untitled20 - Jupyter Notebook' and shows the URL 'localhost:8888/notebooks/Untitled20.ipynb?kernel_name=python3'. A blue notification bar at the top of the Jupyter interface mentions a migration plan for Notebook 7. The Jupyter header shows 'jupyter Untitled20' with a 'Last Checkpoint: a few seconds ago (unsaved changes)' and a 'Logout' button. The menu bar includes 'File', 'Edit', 'View', 'Insert', 'Cell', 'Kernel', 'Widgets', and 'Help'. The toolbar contains icons for file operations, running, and code execution. The main area shows a code cell with the following Python code:

```
In [*]: import numpy as np
from sklearn.feature_extraction.text import TfidfVectorizer
from sklearn.cluster import KMeans

# Simulated real-time data collection (replace with actual data input)
def get_input_data():
    input_text = input("Enter text: ")
    return input_text

# Sample data with emotion labels (for demonstration)
data = [
    ("I'm feeling great today!", "happy"),
    ("I can't believe this happened.", "sad"),
    ("This is so frustrating!", "angry"),
    # ... more data points with corresponding emotions
]

# Extract features from text using TF-IDF
tfidf_vectorizer = TfidfVectorizer()
X = tfidf_vectorizer.fit_transform([sample[0] for sample in data])

# Apply K-means clustering
num_clusters = 3 # Number of clusters representing different emotions
kmeans = KMeans(n_clusters=num_clusters)
kmeans.fit(X)

# Real-time emotion recognition loop
while True:
    new_text = get_input_data()
    new_text_features = tfidf_vectorizer.transform([new_text])
    predicted_cluster = kmeans.predict(new_text_features)

    # Map predicted cluster to emotion label
    emotion_labels = ["happy", "sad", "angry"]
    predicted_emotion = emotion_labels[predicted_cluster[0]]

    print(f"Input text: {new_text}")
    print(f"Predicted emotion: {predicted_emotion}\n")
```

A pink warning message is visible at the bottom of the code cell:

```
C:\Users\lenovo\anaconda3\Lib\site-packages\sklearn\cluster\_kmeans.py:1412: FutureWarning: The default value of 'n_init' will change from 10 to 'auto' in 1.4. Set the value of 'n_init' explicitly to suppress the warning
```

The Windows taskbar at the bottom shows the search bar, task view, and several open applications including a terminal, file explorer, and web browsers. The system clock indicates 21:42 on 07-08-2023.

OUTPUT

```
print(f"Input text: {new_text}")  
print(f"Predicted emotion: {predicted_emotion}\n")
```

```
C:\Users\lenovo\anaconda3\Lib\site-packages\sklearn\cluster\_kmeans.py:1412: FutureWarning: The default value of `n_init` will  
change from 10 to 'auto' in 1.4. Set the value of `n_init` explicitly to suppress the warning  
super()._check_params_vs_input(X, default_n_init=10)
```

Enter text: i am happy

Input text: i am happy

Predicted emotion: happy
